Contents show] History and development AutoCAD was originally developed in 1982 by Paul Tarrant at the then-called the AutoDesk company. In 1983, it was acquired by Autodesk and was marketed and sold as a package for microcomputers with built-in graphics cards or graphics hardware. In March 1984, the DOS version was released, and in February 1985, the first version for the Apple Macintosh (the Mac 1, commonly referred to as the Macintosh) was released. Although it was first available on the Macintosh, an early version of the software was also available for the IBM PC. Worked as a separate application and the "drawing" commands could be invoked directly from the command line and the corresponding output could be saved to disk. In the early days, AutoCAD did not provide any undo capability. The command interface was implemented in C and used static text-based displays. However, the command set was static. It was not possible to create new commands to extend the user interface, or to add new capabilities. All changes were done by the developers. The interface was non-interactive and command-driven. In 1985, the first version of AutoCAD became multi-user and able to run on a single machine. In 1985, the command set of the program was extended. The user interface was also changed, and non-interactive commands were added. In 1987, the first version for Windows was released. AutoCAD did not offer a true 3D modeler but relied on the graphics capabilities of the local computer. AutoCAD's early 3D capabilities were based on the use of AutoCAD's 2D planes as the base layer. The first built-in 3D solids capability came in AutoCAD 2.4. In the late 1980s, AutoCAD began to gain market share against DRAW, which was a legacy product released by the founder of Autodesk. It was also popular because it provided the ability to run on any platform. In 1988, the Windows version was released for the 386 processor class, and in 1992, the first version for Microsoft Windows 95 was released. AutoCAD 2000 was the first product that introduced native 3D modeling. In 1993, a version for Windows NT was released. At the time, the NT platform was not well suited for AutoCAD and so Microsoft chose not to support it.

Field of the Invention This invention relates to a hydraulic control system, in particular to a hydraulic control system for a shock absorber. 2. Description of Related Art Japanese patent application publication no. H11-289701 discloses a hydraulic control system for a shock absorber. The hydraulic control system includes a shock absorber having an upper and a lower working chamber, a pump supplying pressurized oil to the lower working chamber, a first control valve for controlling the flow of oil from the pump to the lower working chamber, a second control valve for controlling the flow of oil from the lower working chamber to the pump, and a load detector detecting the operation state of a vehicle. The second control valve is provided with two spool valves. The spool valves are switched in response to oil pressure from a drive line of a vehicle. This prevents the occurrence of surging of oil pressure of the upper working chamber when the fluid level of the lower working chamber is high and also prevents a risk of oil pressure increase in the upper working chamber when the fluid

level of the lower working chamber is low.Q: Re-initialize selectbox value in html My select box is populated from a database, that I get from an api call. I have the button in the view that when clicked populates the select box with the values, but I want to re-populate the box when the page is loaded. I was trying with: var selectBoxValue; // Call the api to get the select box values // Then I put them in the select box \$(document).ready(function(){ selectBoxValue = \$('#selectBox').val(); }); // Add a click function for the button \$('#buttonPopulate').click(function(){ \$.post('/getProduct',{ }, function(data) a1d647c40b
