Selective estrogen receptor modulator-induced activation of cyclic adenosine monophosphate response element-binding protein. We previously reported that estrogen receptor alpha (ERalpha) and delta (ERbeta) play important roles in the regulation of gene expression in the rat pituitary. We have now characterized the mechanism of the biphasic effect of 17beta-estradiol (E2) on cyclic adenosine monophosphate response element (CRE)-binding protein (CREB) activation in PC12 cells. E2 (10(-8)M) increased intracellular cAMP in PC12 cells but CRE-luciferase activity did not change significantly. 17alpha-Ethinylestradiol (EE) (10(-8)M) did not change intracellular cAMP but significantly increased CRE-luciferase activity. In contrast, ICI 182,780 (10(-8)M) increased intracellular cAMP and did not change CRE-luciferase activity. E2 and EE activated the ERalpha in the presence or absence of ICI 182,780. On the other hand, ICI 182,780 did not activate the ERbeta. E2 stimulated the DNA binding of CREB and both ER subtypes. ICI 182,780 inhibited the E2 effect. The E2-induced CRE-luciferase activity

Conduction anesthesia in the transected sciatic nerve: neurotrophic effects. Traumatic injuries to peripheral nerves frequently cause disruption of the axonal and Schwann cell elements. The resulting gap in the nerve is a favorable substrate for the regeneration of severed axons. The extent of regeneration depends in large part on the milieu provided by the peripheral nerve stump. We tested the neurotrophic effects of a sciatic nerve gap by transecting the sciatic nerve of adult male Wistar rats. In the 15 day post-operative period, when the growth-promoting effect of the nerve is at its maximum, the distance between the distal and proximal ends of the transected nerve was 21.2 +/- 2.5 mm (mean +/- SEM). The reestablishment of nerve continuity with a silicone tube was followed by a delay in the onset of functional recovery. When the tube was removed at 10 days, animals regained ambulation within two weeks, and extensor and flexor force within four weeks. Functional recovery was maximal at 15 days in animals with nerve continuity and at 30 days in those with nerve coaptation; when the tube was removed on day 15, functional recovery became progressively worse and, by day 35, force production fell to levels recovered by nerve coaptation on day 30. Animals with transected nerves coapted with silicone tubes showed significantly increased mechanical force compared to animals with unoperated nerves at any time point (P less than 0.05).
