
trying to post the data with a key:value pair. (using json data) Here is my code: `var context = this; var key = 'email'; var email = app.email; var success = app.success; var error = app.error; var categoryID = context.api.categories.categoryID; axios.post('', {data: key, email: email, categoryID: categoryID, success: success, error: error }) .then(function (response) { context.api.categories.categoryID; context.api.categories.success = response.data; context.api.categories.error = null; return context.api.categories.success; }) .catch(function (error) { context.api.categories.error = error; return context.api.categories.error; })` I have also tried: `var data = JSON.stringify({data: key, email: email, categoryID: categoryID, success: success, error: error})`
Thanks for any help. A: Set your data property in an object. `data: { data: key, email: email, categoryID: categoryID, success: success, error: error }` Q: Why is this question, ostensibly on theory of Christianity, closed as off-topic? I guess this question illustrates what I think is a problem with the often poorly defined close reasons as currently applied: Questions about theory of Christianity are often framed as questions about Biblical texts, and that appears to be the reason that questions not specifically about Bible are closed as "off-topic". If the question were posted about Hinduism or Islam, for example, it would
