Stewart Thomas S. Stewart (born May 15, 1945) is an American physical chemist, a member of the National Academy of Sciences. He is Howard Hughes Professor of Chemistry at the California Institute of Technology, director of the Caltech Center for Biological Structures, and past president of the Division of Physical Sciences of the American Physical Society. He received his B.S. from Tufts University in 1966, and his Ph.D. in 1969 from the California Institute of Technology with George L. Paul in the laboratory of Charles H. Townes. In addition to his work on spectroscopy and photochemistry, he has made important contributions to the history of biology through his work on the iconography of science and the history of biological systems. He has had particular interests in thinking about historical developments through the lens of social systems and networks. He is especially noted for introducing the concept of "radical science" to the North American physics community, leading to a resurgence of interest in radical science. Along with Jack W. Szostak, he is one of the founders of the scientific journal Radical Science. References External links Thomas S. Some individuals are repeatedly susceptible to travel-related diarrhea. Seasonality, water and food sources, geographic and health transition factors and predisposing enteric pathogen infections may influence susceptibility. In addition, host characteristics may contribute to risk of disease. This review considers the evidence that two factors, probiotic use and delayed rehydration, may contribute to the risk of diarrhea. The evidence on host susceptibility factors is less convincing. Several lines of evidence support consideration of water and food sources in the prevention of diarrhea. Ethnic food associations with disease risk are described. The pathophysiology of persistent diarrhea is reviewed, and the c6a93da74d
