
PhotoPrint Server Pro 50 V2 ((FULL))

we have created this manual to help you use the photoprint server. it provides installation and configuration instructions, and a set of reference materials. this manual includes: installation & configuration: the first section of this manual includes instructions for installing and configuring the photoprint server software and the components that it uses to print. this section includes information about: multiple clients printing to the same printer will use the available resources of the server. server scalability depends on the configuration of the printer and the number of clients. for example, if the printer is configured to provide a certain amount of cpu usage, the number of users that can run multiple simultaneous jobs is determined by the available cpu. printers that support the open xml paper specification (also called xps or openxps) require only minimal server support, even when the server is configured to use server-side rendering. printers that support pcl6 or postscript are less efficient than xps because they are vector formats. they require fewer resources than a printer that uses a low-end raster-based image editor. some non-microsoft software can affect server scalability. for example, if print server uses a non-microsoft accounting package that runs as a system service and tracks print usage information, it would likely consume cpu. non-microsoft port monitors may provide similar effects. depending on their implementation and interaction with the system, this type of software could create additional workload that reduces performance.
