There is no such thing as too many Photoshop-related reviews, but some of the later those issued in 2013 were far less detailed than those earlier reviews. Not too long ago, I contacted Mr. Corvus and asked him not to write for me anymore. At the time, it appeared that working with Photoshop was getting a bit too frustrating at times. "One-dimensional" I told him. "Creativity is not something you can be taught or coached," he replied.

This is a problem today, too, but down the line. Photoshop CS5 offers a lot of new features. Best of all, it's the first one to be free after it became available in the Mac version, a process that will get longer as the OS X version of Photoshop is upgraded. In the past, some reviewers seemed to be of the view that, the more features, the more successful the application became. That suspicion was unfounded. In the end, the more features, the more complicated the application became.

For most people, it is difficult to perceive that there is anything other than a digital image on the screen. Just like with ink, a printed photograph acts somewhat differently from the same original. The same is true with digital images. Some of the 10-15% differences won't show up in a small print, and all of them will be lost when seen on a monitor. Computer monitors are not necessarily true representations of what the human eye sees. The simulated colors that we perceive when looking at a print are in part determined by our retinas, which transfer the colors to the brain. The same is true of computer monitors. It takes a bit for our brains to adjust to the colors as they register on the monitor.

Photographs and images are collections of digital information that are stored and displayed in very complex ways. Static or Flash pages can often be more challenging in terms of manipulating light/dark areas and getting a good 'glow' effect on the darker areas. It is important to have some experience of using Photoshop before beginning to develop more complex (interactive) Flash projects.

Menus are at the top of the screen. At the top of a layer is the Transparency panel's Key menu. You can change a layer's colour, brightness, or size. In the Layers panel is the Colour panel and the Layer panel. You will find the Layers panel on the right side of the screen. You can use the Layers panel to select, delete, move, or resize layers, and make copies of them. You can resize a picture layer by using the Width menu in the Layers panel pane.

In many cases, the finished design stays the same as the original, but there are times when a change is needed. Perhaps you want to make a picture look more interesting, or hide part of the design, or sharpen up a blurry photo.
